The station at Wolcott is built on the Dakota sandstone, which in a short distance to the west rises above track level, so that the underlying variegated shale and sandstone (Gunnison formation) and the rocks still lower in the geologic column come into view as the traveler pursues his way down the river bank. As the train rounds the first sharp curve below the station the variegated beds of the Gunnison formation may be seen on the north (right), where they have been exposed by the cutting for the railroad track. About a mile below the village the Dakota lies about 300 feet above the level of the track and the light-red sandstone of the Triassic makes its appearance at that level, but it is so poorly shown that the traveler may not be able to identify it. A view down the river valley...
